SOHAM DABHOLKAR

Spider-Man Inspired Developer Portfolio

Antigravity build brief

A detailed, ready-to-paste prompt for creating a polished, responsive, animated personal portfolio.

Creative direction: cinematic Spider-Verse energy, premium editorial layout, bold red/blue accents, dark city-night atmosphere, elegant motion, and clean developer-focused storytelling.

Prepared using the portfolio details and preferences shared in previous conversations. Verify any uncertain dates or scores before publishing.

1. MASTER PROMPT — COPY EVERYTHING BELOW INTO ANTIGRAVITY

Build a complete, production-quality personal portfolio website for **Soham Suhas Dabholkar**, a third-year B.Tech Computer Science student specializing in Artificial Intelligence and Machine Learning at JSPM University, Pune. The website must feel like a premium, cinematic Spider-Man-inspired digital experience while still being professional enough for software engineering, AI/ML internships, campus placements, recruiters, and project reviewers.

Do not create only a static mockup. Build the actual responsive website with working navigation, functional links, real project cards, smooth animations, accessible interactions, and a clean, maintainable codebase. First inspect the project files and existing setup, then implement the complete site. If the repository is empty, initialize the project with a sensible modern stack.

2. VISUAL CONCEPT & ART DIRECTION

- **Theme:** Spider-Man / Spider-Verse inspired, but original. Use web patterns, subtle comic-panel geometry, city-at-night imagery, motion trails, halftone textures, spider-sense rings, and tasteful red/blue lighting. Do not use a copyrighted movie poster, actor likeness, or copied website layout.
- **Palette:** near-black/navy background (#0B1020 or similar), Spider-Man red (#E32636), electric blue (#1F6FEB), white text, and restrained muted slate for supporting text. Keep contrast high and avoid a dull grey-heavy design.
- **Style:** blend a high-end creative developer portfolio with editorial typography, asymmetric composition, generous whitespace, oversized headlines, crisp cards, soft glow, glass-like overlays only where useful, and carefully controlled gradients.
- **Reference research:** use Dribbble, Behance, and Pinterest as inspiration for motion design, hero composition, typography, card layouts, color usage, and creative portfolio presentation. Do not copy any single design. Synthesize an original design tailored to Soham.
- **Motion language:** fluid, confident, purposeful. Use short, smooth easing; avoid excessive bouncing, constant movement, distracting particles, or animations that slow reading.
- **Spider-Man details:** a thin web-line motif in corners, a small spider emblem or abstract web icon, red/blue edge lighting, a city skyline silhouette, and a web-swing-like transition accent. Keep these as design details rather than turning the site into a childish fan page.

3. TECH STACK & IMPLEMENTATION EXPECTATIONS

- Preferred implementation: React + Vite, JavaScript or TypeScript, Tailwind CSS, and Framer Motion (or a lightweight equivalent) for animation. Choose compatible stable dependencies and explain any deviation briefly.
- Use reusable components, a consistent spacing/type scale, clean folder structure, and centralized project/profile data so content is easy to edit.
- Use Lucide icons or another consistent icon set. Avoid emoji as the primary interface icons.
- Use CSS/SVG for web lines, subtle backgrounds, glow effects, and decorative geometry. Optimize any images and do not depend on huge video backgrounds.
- If using a 3D effect, keep it lightweight and provide a graceful fallback for low-powered devices and reduced-motion preferences.
- Do not add fake backend functionality. Contact form submission should either use a clearly configured service or open a mailto fallback, and the setup steps must be documented.

4. SITE MAP & PAGE SECTIONS

Create a single-page portfolio with smooth anchor navigation, plus a dedicated project-detail route/modal only if it improves usability.

A. Navbar

- Logo/wordmark: “SOHAM.” with a subtle web motif.
- Links: Home, About, Skills, Projects, Experience, Contact.
- Sticky or smart navbar that changes subtly on scroll; active-section indicator; mobile menu with a polished open/close animation.
- A clear “Let’s Connect” CTA. Do not crowd the header.

B. Hero / first screen

- Small eyebrow: “THIRD-YEAR CSE • AI & MACHINE LEARNING”.
- Main headline idea: “Building intelligent things. One line of code at a time.” Alternative punchy line: “Your friendly neighbourhood developer.” Use the second line as a playful accent, not the only professional headline.
- Name: Soham Dabholkar. Supporting copy should explain that he builds AI/ML experiments and web experiences, turning ideas into useful products.
- Primary CTA: “Explore Projects”. Secondary CTA: “Contact Me”. Add “View GitHub” as a smaller link.
- Visual: original Spider-Verse-inspired silhouette/abstract masked-hero motif, glowing web lines, or a city skyline with a subtle parallax. Keep the face/photo area replaceable with a real portrait; do not invent a real photo of Soham.
- Include a compact availability/status pill only if it can be edited easily. Do not falsely claim that he is currently available for a specific role.

C. About

- Tell a genuine, concise story: a third-year CSE (AI & ML) student in Pune who enjoys building software, exploring machine learning, and turning concepts into interactive projects.
- Emphasize curiosity, hands-on learning, problem-solving, and the intersection of AI and practical software development.
- Use 2–3 short paragraphs or a split layout with a creative portrait/graphic. Avoid generic claims like “I am the best developer”.
- Add compact fact chips: Pune, Maharashtra; B.Tech CSE (AI & ML); expected graduation 2027.

D. Skills / tech stack

- Group skills rather than displaying one huge wall of tags: Programming; Frontend; Backend & APIs; Databases; AI/ML & NLP; Tools & Platforms.
- Known skills to represent carefully: Java, Python, JavaScript, PHP, HTML, CSS, Tailwind CSS, Flask, FastAPI, Streamlit, MySQL, SQLite, Git, GitHub, VS Code, SQL, NLP, TF-IDF, PyTorch, Transformers, and XLM-RoBERTa. AWS/GCP may be included as exposure/learning rather than advanced expertise.
- Only show a technology as a core skill if Soham is comfortable discussing it in an interview. Do not invent skill ratings or progress percentages.
- Use tasteful icons and hover states; support keyboard focus and touch devices.

E. Featured projects

- Create a strong, visually varied project grid with 4–5 cards initially. Include project title, problem solved, short outcome/feature summary, relevant stack, and buttons for Live Demo and Source Code only when real URLs are supplied.
- Feature the multilingual feedback intelligence platform first as the flagship/ongoing project.
- Use distinctive card compositions: one wide featured card, two standard cards, and optional compact cards. Avoid repetitive generic rectangles.
- Project filters may include AI/ML, Web Development, NLP, and Tools, but only add them if they work properly.
- For projects without verified public links, show a “Details” action or an editable placeholder in the data file. Never fabricate repository or deployment URLs.

F. Experience / education

- Education timeline: B.Tech / B.E. Computer Science (AI & ML), JSPM University, Pune, expected 2027; Diploma in Computer Engineering, Government Polytechnic Ratnagiri, 2021–2024; SSC, Maharashtra State Board, 2021.
- Mention basic web developer experience at Emirate Solutions, Ratnagiri, only with a modest, accurate description. Dates and detailed responsibilities should remain editable if not confirmed.
- Use a clean timeline or compact editorial layout with a subtle animated web/thread connecting milestones.

G. Currently exploring

- Optional section describing current learning through self-study in machine learning and ongoing experimentation with AI/NLP and full-stack development.
- Keep the wording honest: learning and building, not claiming senior-level expertise.

H. Contact / footer

- Headline: “Have an idea? Let’s build something useful.”
- Contact links: email (use a clearly editable placeholder until the correct address is provided), LinkedIn, GitHub, and portfolio URL.
- A simple accessible contact form with name, email, message, validation, success/error states, and documented integration instructions. If no email service is configured, make the fallback explicit.
- Footer: “Designed & built by Soham Dabholkar” and a tiny spider-web accent. Include back-to-top interaction.

5. PROJECT CONTENT — START WITH THESE

1. Multilingual Feedback Intelligence Platform (Ongoing / flagship)

A planned platform where a user can sign in, submit a YouTube video or supported social/e-commerce link, and receive structured insights from comments or reviews. The concept includes sentiment analysis, sarcasm detection, onomatopoeia-aware interpretation, feedback summaries, visual dashboards, and saved previous analyses. Long-term sources discussed include YouTube, Instagram, X/Twitter, and e-commerce. Clearly label unsupported integrations as planned; do not claim every platform integration already works.

2. ATS Resume Checker Pro

A resume analysis tool concept/project using a Flask-based workflow and PDF text extraction, with section detection and text-matching techniques such as TF-IDF. Present it as a resume review helper. Only list features that are implemented and verified; do not promise guaranteed ATS scores or hiring outcomes.

3. Pizza House / Cafe Website

A food ordering website built with HTML, CSS/Tailwind, and JavaScript, with a restaurant/cafe visual experience and ordering-related interface. Mention cart, payment, chatbot, admin, or authentication features only if confirmed to be working in the current version.

4. Virtual Lab Website

An educational virtual-lab experience intended to make practical learning more accessible through a web interface. Explain the actual experiments or modules once verified. Avoid unsupported comparisons or claims that it is better than another named website.

5. Gold Price Prediction (optional / in progress)

An ML experiment exploring gold-price time-series prediction with LSTM, market data, and USD-to-INR conversion. Label it as experimental and explain that predictions are not financial advice. Include only if the implementation is stable enough to demonstrate.

6. ANIMATION & INTERACTION SPECIFICATION

- **Page load:** a quick logo/web-line reveal, then staggered hero text and CTA entrance. Keep it under control and do not make users wait to use the site.
- **Scroll:** reveal sections with subtle opacity + translate motion; stagger cards slightly; animate the timeline draw-on effect once.
- **Hover:** project cards may lift by a few pixels, glow at the border, or reveal a small web-line sweep. Keep text readable and buttons obvious.
- **Pointer:** optional faint spider-sense/radial glow on desktop only; disable on touch devices and avoid tracking the pointer in a distracting way.
- **Transitions:** smooth anchor scrolling, polished mobile menu, filter changes, and modal transitions. No jarring page jumps.
- **Performance/accessibility:** respect prefers-reduced-motion, keep focus indicators visible, ensure sufficient contrast, avoid scroll-jacking, and ensure all content works with animations disabled.
- **Responsive:** design mobile-first. Test small phones, tablets, laptops, and wide screens. No horizontal overflow or tiny tap targets.

7. DESIGN QUALITY BAR

- The result should feel custom-designed, not like a default SaaS template or a generic AI-generated portfolio.
- Use deliberate typography pairing, excellent spacing, a clear visual hierarchy, and strong section-to-section rhythm.
- Keep the Spider-Man theme recognizable through atmosphere and details, while maintaining professional credibility for recruiters.
- Use high-quality original/royalty-safe visual assets or CSS/SVG-generated graphics. If external imagery is used, optimize it and document the source/licence.
- Avoid excessive glassmorphism, overused purple gradients, random blobs, giant skill percentage bars, fake testimonials, fake company logos, fake statistics, and unverified awards.
- Make every CTA useful. Remove placeholder buttons that do nothing.

8. PERSONAL DETAILS & LINKS TO USE

Display name: Soham Dabholkar (full name: Soham Suhas Dabholkar)

Location: Pune, Maharashtra, India

Current education: B.Tech / B.E. Computer Science (AI & Machine Learning), JSPM University, Pune; expected graduation 2027

Previous education: Diploma in Computer Engineering, Government Polytechnic Ratnagiri, 2021–2024; SSC Maharashtra State Board, 2021

LinkedIn: https://www.linkedin.com/in/soham-d-55a1a322b/

GitHub: https://github.com/soham2oo5

Existing portfolio: https://sohamportfolio-six.vercel.app/

Email: Not confirmed in this brief — use a clearly marked editable placeholder and do not invent an address

9. FINAL DELIVERY REQUIREMENTS

- Deliver the full working source code, not just screenshots or a design description.
- Make the project runnable locally with clear install/run commands and a README.
- Include a centralized data file for personal details, skills, education, experience, projects, and social links.

- Add clear comments wherever Soham must replace a placeholder, add a project URL, configure an email service, or confirm a detail.
- Check all navigation anchors, external links, form validation, mobile menu, reduced-motion behavior, console errors, and responsive breakpoints.
- Provide a concise completion summary: stack used, files created/changed, how to run locally, how to deploy, and which content still needs confirmation.
- Do not claim a feature was tested unless it was actually tested. If a third-party API or service requires credentials, explain the setup instead of hardcoding secrets.

10. CONTENT ACCURACY RULES

- Do not invent achievements, certifications, grades, employers, project metrics, testimonials, awards, or job availability.
- Do not publish personal phone number or private information unless supplied intentionally.
- Some project details are evolving. Make all content easy to edit and clearly distinguish completed, ongoing, and planned features.
- For education scores, use only the value Soham confirms before launch; if unsure, omit the percentage rather than guessing.
- Use first-person, natural writing. Avoid exaggerated phrases such as “world-class”, “expert in every technology”, or “revolutionizing the industry”.

SUCCESS CRITERIA

The finished portfolio should immediately communicate who Soham is, what he builds, and how to contact him. It should feel cinematic and memorable because of the Spider-Man-inspired art direction and motion, but remain fast, accessible, credible, easy to maintain, and ready to show to internship recruiters.

End of prompt.
